

The concept behind my design is that I will be taking over the website diveourplanet.com and doing a redesign to implement new concepts. It will be a blog on the client's scuba diving adventures that their followers and customers can look at. There will be section where they rate and review dive equipment, destinations, and have the ability for people to shop as well. This will be a portfolio of sorts for them since they are dive masters and people can view their experience that would make them want to go diving with them.

I will build the site using WordPress. The home page will have a photo carousal of actual photos they have taken. Above that will be the site name and a menu to navigate to each of the pages. Below that there will be the latest blog posts. There will be links to the rest of the blog post, bios of the clients, and ways to contact them to go on dives.

Along with WordPress I will install a theme and fully customize using JS and CSS. I will also use plugins to ensure security and site optimization. The site will have a photo section of their adventures as well as their blog. Some plugin I will look into is OmniGallery, Google Authenticator, and All in One WP Security.

Here is the site structure.

Here is what the home page will look like.
